

DATABASE SYSTEM AND METHOD FOR ORGANIZING AND SHARING INFORMATION

Abstract of the Disclosure

5 A database stores records of resources that include web pages and web-accessed
files, electronic files, and hardcopy documents. The URL of a web page or web-
accessed file, the file access path of an electronic file, and the location of a hardcopy
document are stored in the records. The records can be created by a user. The user can
store an Internet link record when the user is browsing the web page or reviewing the
10 web-accessed file. The user can store an electronic file record when the user is
exploring files. The user can enter descriptions and notes that associate with the
records. The resources can be organized into categories and sub-categories. For
example, certain web pages and web-accessed files, electronic files, and hardcopy
documents that cover the same subject can be grouped into one category. The records,
15 including the descriptions and notes of the records, can be shared by other users that
have access to the same database.
